The primary purpose of my research is to provide reliable scientific information for devising effective solutions to improve the atmospheric environment while enhancing sustainability and livability under the threat posed by a changing climate. Most of my research activities involve *in-situ* measurements, data analysis, and to a lesser degree, numerical modeling. I am interested in the interactions between the urban surface and overlying atmosphere in terms of mass and energy exchange, the chemical and physical processes that lead to air pollution, the exposure to pollutants and heat in public spaces, and the impact of urbanization on the carbon cycle.

I can divide my research into four fields: Air quality, Urban micrometeorology, Personal exposure, and Urban carbon sequestration. Each of them is described in detail on my [Personal Website](#).

TEACHING EXPERIENCE

Teaching Philosophy

I make students realize that the environment is not "out there", but that we are a part of it. I provide students with a solid understanding of environmental sciences and then engage them in fieldwork to boost their creativity and environmental consciousness. The most important aspect is to teach students how to think on their own, help them come up with their own ideas, and let them make a few mistakes. In the case of graduate students, they must learn to apply the scientific method while pursuing innovative and exacting research with a strong commitment to society.
